

Replacement of black electronic unit on BD35F & BD50F compressors

The electronic unit is locked in position with one locking screw which can be seen in a hole in the white sticker. **Tighten** the screw (screw in) maximum.

Grab the electronic unit as shown on the picture and turn it out, the plastic housing will slide over the locking screw. The other side is kept in position by means of an angle on the bracket.

The 3-wire connector is mounted on three plain pins on the compressor housing. The connector can be pulled off. Possibly, a flat screwdriver could be used for assistance, place it between the compressor and the connector.

Mounting of the black electronic unit on the compressor is made in opposite order to the description above. Lock the electronic unit in position with the locking screw, turn this anti-clockwise 2-3 turns.
